

UAS AND PRECISION AGRICULTURE: SAFE, SCALABLE, SMARTER

Ally Ferguson

Director, Airspace Safety Research

THE FOCUS IS INFORMATION

The platform is the means, not the end goal

INTRODUCING THE **SMARTER FARMING PACKAGE**

PRESENTED BY:

PRECISIONHAWK

- Complete analytics platform at an accessible price point
- Compliments existing workflows by integrating with the new intelligent farm equipment.
- The goal is a single step for the farmer, from the drone flight to the next farm management action.

APPLICATIONS OF AERIAL DATA ANALYSIS

AGRICULTURE

- + Crop health indices
- + Plant height
- + Canopy cover
- + Weed detection
- + Season monitoring

OIL & GAS

- + Oil spill tracking
- + Pipeline monitoring
- + Environmental assessment

ENVIRONMENT & CLIMATE

- + Land cover mapping
- + Carbon capping
- + Renewable energy

WATER

- + Irrigated land mapping
- + Impervious surface mapping
- + Watershed planning

DISASTER RESPONSE

- + Wildfire
- + Flooding
- + Damage assessment
- + Rapid response

FORESTRY

- + Biomass
- + Forest health
- + Disease detection

UTILITIES

- + Vegetation management
- + NERC ROW monitoring
- + Asset verification

INSURANCE

- + Crop claims assessment
- + Structural damage assessment
- + Underwriting and reinsurance validation

...but how do we
enable all these
applications?

MIND THE GAP

How does the current regulatory environment impact agricultural use?

Current	Needed
Visual Line-of-Sight Operations Only	Beyond Visual Line-of-Sight with option to transit between fields
2 Person (Minimum) Team	Solo Pilot in Command
FAA Sport Pilot License (minimum) and FAA Medical	Minimal training with no formal manned aircraft certification
Lengthy approval processes	Streamlined regulatory compliance, “routine use”

Where are the roadblocks and how can we resolve them?

THE PARADOX

SAFETY AND SCALABILITY

Equally important for system design...and NOT necessarily in opposition!

The system must accommodate rising demand

TECHNOLOGY AS A SOLUTION

Integrating new technologies into the NAS

SCALE

WE NEED BETTER DATA

- How do these new technologies change the risk profile on nationwide scale?
- Highly localized experiments to date not sufficiently answering the questions we have
- *The paradox: we can't operate at a nationwide scale without data to make the safety case, but we can't get the data we need unless we operate at nationwide scale*
- Whitepaper available at:
<http://www.precisionhawk.com/UAS-Integration-Whitepaper.pdf>

TECHNOLOGY

BREAKING THE PARADOX

Drive creation of concept of operations for subsection of Class G

Current small scale operations to understand risk:

- Pathfinder
- UAS test sites
- ASSURE
- Extensive research and simulation

Operating on a National Level

- Directly address primary, commercial use cases as defined by market research: precision ag, critical infrastructure surveillance
- Assessing how technologies can operate on national scale

BUILD ON RESULTS TO DEFINE RISK PROFILE ON NATIONAL SCALE

PRECISIONHAWK PLAN

Realizing the vision while mitigating unknown risk

Define UAS Service Volume (USV):

- Class G
- Low population density
- Land designated for agriculture or critical infrastructure use

What does this look like?

- Consider an area covering Louisiana and part of Texas

BUILD ON RESULTS TO DEFINE RISK PROFILE ON NATIONAL SCALE

PRECISIONHAWK PLAN

Realizing the vision while mitigating unknown risk

Define UAS Service Volume (USV):

- Class G
- Low population density
- Land designated for agriculture or critical infrastructure use

What does this look like?

- Consider an area covering Louisiana and part of Texas

BUILD ON RESULTS TO DEFINE RISK PROFILE ON NATIONAL SCALE
